This is a quickstart guide, the full documentation can be viewed here:
https://staggart.xyz/unity/stylized-water-2/sw2-underwater-rendering-docs/

At this point you should already have the Stylized Water 2 package installed. The Underwater extension will import into its folder.

The minimum version requirement of the Stylized Water 2 base asset is **v1.1.5**.

Initial set up

To enable underwater rendering in a scene, go to *Window → Stylized Water 2 → Set up underwater renderer.*

Assign the material that is used in the scene and set the water level to match the Y-position (in world-space!) of the water mesh. *If there is only 1 water object in the scene, the water material and level will be automatically configured for you.*

A notification with quick-fix button will be displayed if any other set up is required.
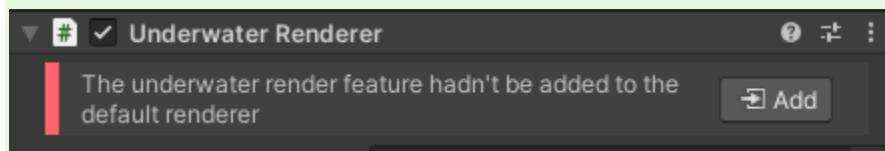

You're now set! The waterline and underwater fog will automatically render once the bottom of the screen touches the water.

For the best visual quality, ensure Refraction and Reflections are enabled on the water material
